What are cloud solutions?

- At the most basic level, cloud computing is the ability to access computers that are not on local premises.

- In practise, cloud technology is an umbrella term for a variety of different computing services (file storage, compute, Platform as a Service (PaaS), cloud functions and pipelines)

- There are a number of cloud providers, at OE we have access to Azure and AWS. Azure is my preferred choice because of its integration with Active Directory (Microsoft) and the more verbose naming conventions (Azure App Service vs. AWS Elastic Beanstalk)
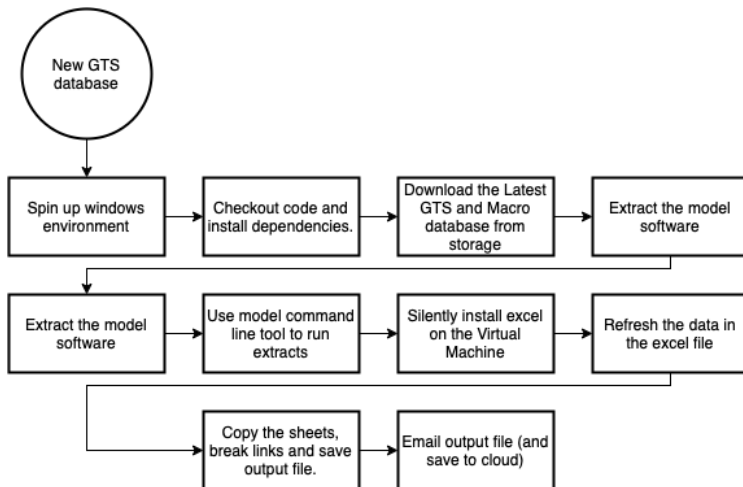

Pipelines

- Pipelines are automated tasks that run in the cloud they can be triggered by pushing to a git repository, or through an API call.

- There are number of providers that offer pipelines but I have been using CircleCI because of their free tier.

Example 1: Whitbread Outputs (Basic)

- Whitbread take a very basic quarterly breakdown of some GTS and Macro model indicators.
- The process is:
  1. Run the macro and GTS extract
  2. Update the links in the model file
  3. Copy the output sheets into a new workbook.
  4. Break links and save.
- Manual process time 40 minutes - 1 hour.

Creating a pipeline

New GTS database → Spin up windows environment → Checkout code and install dependencies. → Download the Latest GTS and Macro database from storage → Extract the model software → Extract the model software → Use model command line tool to run extracts → Silently install excel on the Virtual Machine → Refresh the data in the excel file → Copy the sheets, break links and save output file. → Email output file (and save to cloud)

Languages & Technologies Used

- Python - for running some of the orchestration
- PowerShell - Interacting with Windows & Excel
- Azure Storage - storing the database files
- Git - Managing the project and codebase
- CircleCI YAML - Writing the pipelines steps

Time saving

Manual method: 1 hour.
Pipeline method: 8 minutes

Example 2: Country Report Generation (Advanced)

- The country report generator create $\sim$ 40 PDF reports with text and plots.
- The manual process:
  1. Creation of input file.
  2. Load excel file for each report.
  3. Update the links in each excel file.
  4. Rewrite boiler plate text to reflect new data.
  5. Fix plots where necessary.
  6. Write custom commentary.
  7. Save to PDF.

Creating a pipeline
Languages & Technologies Used

- Python - for orchestration, creating text and plots.
- Azure Storage - storing the input and output files
- Azure Functions - triggering the process when a new input file is added.
- Node.JS - application architecture and PDF generation.
- Git - Managing the project and codebase
- CircleCI YAML - Writing the pipelines steps.

Time saving

Manual method: 3 people 3 days.
Pipeline method: 10 minutes + time to write custom text (1 day?).

Sweden Regional TSA PowerPoints

- Creation of 8 regional TSA reports in PowerPoint. The text and graphics are entirely boilerplate.
- Using Python and a package called python-pptx, the code takes the regular output from the Excel model file and outputs the reports in .pptx and PDF.

Time saving

Manual method: Multiple days
Pipeline method: 40 seconds
